

Q1/2

Referer header tells the server what kind of information we are sending.

A True

B False

Well done. Correct Answer.

Explanation:

Referer specifies the URL from which the current request has originated, whereas content-type header tells the server what kind of information we are sending.

User-Agent header is used for which of the following purposes?

- A To tell the server the kind of response we want
- B To tell the server what kind of encoding is being used
- C To tell the server what kind of content the client is willing to accept

D None of the above

Well done. Correct Answer.

Explanation:

User-Agent header provides the information about the browser, the version and software being used. For example : Mozilla/5.0 (Windows NT 10.0; WOW64; rv:47.0) Gecko/20100101 Firefox/47.0 Here Firefox version is 47.0 which is the browser used to send. Windows NT 10.0 means windows 10 was used to send the request and WOW64 means a 64bit windows was used.

POST based SQL Injectio...

Summary

Now that we have come to the end of this topic, you should be able to:

1. Understand the parts of an HTTP request
2. Intercept and inject the POST parameters of an HTTP request

If you have doubts regarding any of the above-mentioned points, please go through the relevant videos and helper text again.
